3. What the analyst is asserting

This is the argued text behind this row's ANALYST numbers, quoted verbatim from sea2027/judgment.py. It is not a measurement, and it is the first thing to disagree with.

Parameter	Value	Parameter	Value
conflict	0.22	ip_exit	0.14
crony	0.90	whitecollar	0.18
unrest	0.05	haven	0.42
polar	0.25	phys_share	0.88
party_frag	0.08	counter	0.03
social_frag	0.30	lux	0.08
protest	0.12	pension	0.15
labour_exit	0.52	ext_threat	0.58

> crony 0.90, the highest in the set: the oknha system ties licence to patronage directly and V-Dem's political-corruption index of 0.904 is the second worst of the eleven. conflict is non-zero for a reason a state-based conflict series would miss - the scam compounds are armed and, on the Prime Minister's own February 2026 account, destroying the legal economy; that is a rival to the coercive monopoly inside Cambodian territory. ext_threat 0.58 is the Thai border: two rounds of fighting in 2025, a 27 December ceasefire that Stratfor rated still holding but non-normalising in August 2026, and Thai forces on ground Phnom Penh calls occupied. haven 0.42 in a dollarised economy where gold is the household savings instrument of record.

4. The θ25 gates

Component	Level	Drift/yr	Threshold	Years	Status
s3	0.384	-0.0099	0.30 [PAPER]	8.4	open
c5	0.222	+0.0070	0.50 [FREE]	39.6	open

s5	0.721	-0.0023	0.15 [PAPER]	247.0	open

s5 — theta25 threshold gate - uncommitted revenue horizon. Degrow's voluntary/aging terminus.

s2 — theta25 threshold gate - coercive monopoly. Degrow's violent/youth terminus.

s3 — sccd loop L2 explosive threshold - the legitimacy death spiral becomes self-sustaining below this.

c5 — sccd loop L3 polarisation-trap threshold. NOTE this one is a FREE parameter in the source paper - no numeric value is given anywhere in Parts I-V - so the crossing date is arbitrary in a way the S2/S5/S3 gates are not.

5. The eight feedback loops

Why these events, and why not others

border re-escalation as an ONSET rather than as standing pressure. Note the catalogue has interstate_war_onset RAISING s2 and s3 - the rally effect sccd Part V documents for 1941-45 - so this event is not uniformly adverse, and that is the engine's reading, not mine.

Trajectory is a STRUCTURAL SCENARIO. Every coefficient in the six new state equations is ANALYST (spec2) and most in the original four are FREE (sccd.spec). Read curve ORDERING, slope SIGNS, and PAPER-threshold crossings. Do not read levels or dates.

11. The 15-year pass: order the gates close in

12. Epistemic limits

CALIBRATION TAGS. CALIBRATED (PAPER parameters only): lambda, theta25, S, the regime band, Psi, L1/L2 activation, R_B, Gamma. UNCALIBRATED (at least one FREE/ANALYST parameter): C and therefore Delta and Delta_norm; L3/L4 activation; ALL of L5-L8; CAI; every trajectory; every gate projection; the attractor choice.

2 parameter(s) flip the qualitative verdict under the +/-20% OAT perturbation sccd eq (SA) mandates: d5_violent_thresh, L4_c1_thresh. A verdict that moves under a 20% nudge to an ANALYST coefficient is a hypothesis, not a finding. Read `fragility` before quoting anything.

S3 is the highest-risk proxy in sccd Part III 2.3 and it is low here. Everything lambda touches - which is all of S - inherits that uncertainty. Widen accordingly.

> sccd Part V 1, verbatim: 'We do not, at this stage, claim predictive precision - generating quantitatively accurate forecasts from an incompletely calibrated formal model would be epistemically irresponsible. The validation standard is qualitative-structural.' The v2 layer is strictly weaker than that again, since all 46 of its parameters are ANALYST.
