3. What the analyst is asserting

This is the argued text behind this row's ANALYST numbers, quoted verbatim from sea2027/judgment.py. It is not a measurement, and it is the first thing to disagree with.

Parameter	Value	Parameter	Value
conflict	0.30	ip_exit	0.35

unrest	0.30	haven	0.38
polar	0.78	phys_share	0.85

social_frag	0.58	lux	0.12
protest	0.85	pension	0.45
labour_exit	0.85	ext_threat	0.45

The one polity where three channels load at once. Legitimacy: the flood-control scandal, with the Department of Finance costing the loss at up to PHP 118.5bn over 2023-25, a 600,000-strong Iglesia ni Cristo rally in November 2025, 37 criminal complaints filed and - as of February 2026 - no sitting legislator detained, plus an allegation that PHP 25bn reached the President himself. The gap between outrage and consequence is what unrest 0.30 encodes. Fragmentation: the Marcos-Duterte rupture is now institutional, with the Vice-President's second impeachment trial running since 6 July 2026 and the Senate court having altered its own conviction threshold in September. Block A: whitecollar 0.72 is the highest in the set - BPO is precisely the task class generative AI substitutes for - against a measured a1 of 0.207, already third highest here. labour_exit 0.85 on remittances at 8.5% of GDP: the exit option is institutionalised, which also caps how much further C4 can rise.

4. The θ25 gates

Component	Level	Drift/yr	Threshold	Years	Status
c5	0.679	+0.0057	0.50 [FREE]	CROSSED	CROSSED
s3	0.304	-0.0102	0.30 [PAPER]	0.4	open

s5	0.571	-0.0031	0.15 [PAPER]	134.9	open

s5 — theta25 threshold gate - uncommitted revenue horizon. Degrow's voluntary/aging terminus.

s2 — theta25 threshold gate - coercive monopoly. Degrow's violent/youth terminus.

s3 — sccd loop L2 explosive threshold - the legitimacy death spiral becomes self-sustaining below this.

c5 — sccd loop L3 polarisation-trap threshold. NOTE this one is a FREE parameter in the source paper - no numeric value is given anywhere in Parts I-V - so the crossing date is arbitrary in a way the S2/S5/S3 gates are not.

5. The eight feedback loops

Trajectory is a STRUCTURAL SCENARIO. Every coefficient in the six new state equations is ANALYST (spec2) and most in the original four are FREE (sccd.spec). Read curve ORDERING, slope SIGNS, and PAPER-threshold crossings. Do not read levels or dates.

s3 below 0.3 [PAPER] @ t=0.33 (crossed during run) — sccd L2 legitimacy death spiral becomes explosive

c1 above 0.7 [PAPER] @ t=0.00 (already past at t0) — sccd capture threshold C1,crit - Gamma turns on

psi below 0.4 [PAPER] @ t=0.00 (already past at t0) — sccd Psi_crit - R_B coherence condition trips

12. Epistemic limits

CALIBRATION TAGS. CALIBRATED (PAPER parameters only): lambda, theta25, S, the regime band, Psi, L1/L2 activation, R_B, Gamma. UNCALIBRATED (at least one FREE/ANALYST parameter): C and therefore Delta and Delta_norm; L3/L4 activation; ALL of L5-L8; CAI; every trajectory; every gate projection; the attractor choice.

2 parameter(s) flip the qualitative verdict under the +/-20% OAT perturbation sccd eq (SA) mandates: d5_violent_thresh, L4_c4_thresh. A verdict that moves under a 20% nudge to an ANALYST coefficient is a hypothesis, not a finding. Read `fragility` before quoting anything.

S3 is the highest-risk proxy in sccd Part III 2.3 and it is low here. Everything lambda touches - which is all of S - inherits that uncertainty. Widen accordingly.

> sccd Part V 1, verbatim: 'We do not, at this stage, claim predictive precision - generating quantitatively accurate forecasts from an incompletely calibrated formal model would be epistemically irresponsible. The validation standard is qualitative-structural.' The v2 layer is strictly weaker than that again, since all 46 of its parameters are ANALYST.
