1. The structural triple, 2026 against 2027

Measure	2026	2027	Δ	Component
Ψ	1.339	1.269	-0.070	λ·θ25·(1−C5)
θ_{25}	0.994	0.993	-0.001	$\hat{S}_2$ / $\hat{S}_5$ gate factor
Δ_norm	0.392	0.371	-0.020	(S−C)/(S+C)
λ	2.040	2.006	-0.034	Hill(S3)
S	1.397	1.386	-0.011	λ-weighted state capacity
C	0.418	0.458	+0.040	civilian capacity / (1+φC5^ψ)
$\hat{S}_3$	0.851	0.821	-0.030	legitimacy, BLOCKED proxy
$\hat{C}_5$	0.340	0.363	+0.023	fragmentation, ANALYST
$\hat{S}_5$	0.407	0.397	-0.010	temporal leverage
$\hat{S}_2$	0.926	0.926	-0.000	coercive monopoly
d_4	0.448	0.455	+0.007	dependency inversion

dΔ/dt = -0.0166 (measured over first 3 yr of trajectory) · decoupling_active = True · decoupling_index = 0.485

d3 high, d5 low - pressure discharges through fertility refusal and then dependency inversion. Degrow's modern path. Terminal gate: S5 falling through theta25's 0.15 floor.

3. What the analyst is asserting

This is the argued text behind this row's ANALYST numbers, quoted verbatim from sea2027/judgment.py. It is not a measurement, and it is the first thing to disagree with.

state_type is the contestable choice in this file. Singapore is electoral and its 2025 mandate was renewed competitively, but sccd's state_type sets only three weights - w1 fiscal, w4 admin, omega25 - and on those three the developmental-autocracy profile (0.35/0.45/0.20) fits the WGI 2025 vector (government effectiveness 95th percentile, voice and accountability 55th) far better than the liberal-democracy row does. run.py re-runs this polity as a liberal_democracy so the reader can see what the choice costs. a1 of 0.643 is the second-highest generative-AI diffusion rate on earth after the UAE, which makes this the one polity in the region where Block A's decoupling condition can be tested on measured adoption rather than inferred. phys_share 0.60, the lowest here: Singapore's haven demand runs through vaults and funds that stay legible, so the L6 legibility channel is weak even where the reallocation is real.

4. The θ25 gates

Component	Level	Drift/yr	Threshold	Years	Status
c5	0.340	+0.0126	0.50 [FREE]	12.7	open
s3	0.851	-0.0264	0.30 [PAPER]	20.9	open

s2	0.926	-0.0000	0.25 [PAPER]	69378.0	open

s5 — theta25 threshold gate - uncommitted revenue horizon. Degrow's voluntary/aging terminus.

s2 — theta25 threshold gate - coercive monopoly. Degrow's violent/youth terminus.

s3 — sccd loop L2 explosive threshold - the legitimacy death spiral becomes self-sustaining below this.

c5 — sccd loop L3 polarisation-trap threshold. NOTE this one is a FREE parameter in the source paper - no numeric value is given anywhere in Parts I-V - so the crossing date is arbitrary in a way the S2/S5/S3 gates are not.

5. The eight feedback loops

Trajectory is a STRUCTURAL SCENARIO. Every coefficient in the six new state equations is ANALYST (spec2) and most in the original four are FREE (sccd.spec). Read curve ORDERING, slope SIGNS, and PAPER-threshold crossings. Do not read levels or dates.

11. The 15-year pass: order the gates close in

2041: **Negotiated / Coherent** · Ψ 0.547 · θ_{25} 0.924 · Δ_norm +0.208 · R_B 0 · L5

c5 13y → s3 21y → s5 32y → s2 69378y

12. Epistemic limits

G/S3 DECOUPLING ACTIVE: output generation is being raised (x1.313) while legitimacy drifts down (-0.0155/yr). No windfall in sccd Parts I-V behaves this way - Part V's 1941-45 case raises both together. Expect Delta_norm and Psi to move in OPPOSITE directions, which the five Delta bands of Part II Table 2 cannot express on their own; read the coherence tier alongside the band.

CLAMPED at the [0,1] boundary: c4. The forcing layer asked for a shift past the end of the normalisation scale, so the clamped level is a ceiling artefact, not a measurement. Treat any result depending on it as ordinal only.

CALIBRATION TAGS. CALIBRATED (PAPER parameters only): lambda, theta25, S, the regime band, Psi, L1/L2 activation, R_B, Gamma. UNCALIBRATED (at least one FREE/ANALYST parameter): C and therefore Delta and Delta_norm; L3/L4 activation; ALL of L5-L8; CAI; every trajectory; every gate projection; the attractor choice.

2 parameter(s) flip the qualitative verdict under the +/-20% OAT perturbation sccd eq (SA) mandates: d4_inversion_thresh, a1_mass_thresh. A verdict that moves under a 20% nudge to an ANALYST coefficient is a hypothesis, not a finding. Read `fragility` before quoting anything.

> sccd Part V 1, verbatim: 'We do not, at this stage, claim predictive precision - generating quantitatively accurate forecasts from an incompletely calibrated formal model would be epistemically irresponsible. The validation standard is qualitative-structural.' The v2 layer is strictly weaker than that again, since all 46 of its parameters are ANALYST.
