SCCD-X v2.00 · PROSE READING · THE 2027 FORECAST

Myanmar (MM)

The gate is shut; the question is what follows

Run 2026-10-09 · horizon to end-2027 · LSODA

The figures this reading rests on

Band	Tier	Mode	Ψ 2027	θ_{25}	Δ_norm	R_B
Equilibrium	Incoherent	MIXED	0.008	0.127	-0.043	0

Loops L2+L3+L6 · Nearest gate s5 ~106y (s2+s3+c5 crossed) · At 15 years Equilibrium / Incoherent

Myanmar is the only polity in the eleven with a θ_{25} gate already CLOSED. $\hat{S}_2$ is below its 0.25 PAPER threshold, so θ_{25} has collapsed to 0.127 and Ψ with it, to 0.008 — two orders of magnitude below anything else in the region. The Monte-Carlo pass returns Equilibrium 100%, which is not stability. There is nothing left to vary.

The gate that closed is the violent one, not the fiscal one. Degrow's two channels terminate in the same object — θ_{25} — through different doors: the voluntary, aging door closes $\hat{S}_5$, and the violent, youth door closes $\hat{S}_2$. Thailand is walking toward the first. Myanmar has already gone through the second. $\hat{S}_5$ remains 106 years away and is irrelevant.

The input that drives this is a conflict coding of 0.95, and it is worth being precise about what that asserts. It is not a claim about who is winning. It is the statement that no actor holds a monopoly. BTI 2026 puts junta authority as contested in over two-thirds of the territory with more than half of 330 townships in active conflict; stable Tatmadaw control was put at between 72 and 220 of those townships as of December 2025; the Arakan Army holds most of Rakhine; three regional commands have fallen. The December 2025 phased election changed the legal claim to authority, not the control map.

Administrative penetration is 0.089 and legitimacy 0.139 — both effectively at the model floor after boundary compression. Three loops run (L2, L3, L6) but the loop set is almost beside the point: with θ_{25} at 0.127, Ψ cannot recover through any of the channels the loops operate on.

One negative result deserves stating, because the row was built to test it. **L8, the Youth-Surplus Discharge, does NOT fire.** L8 exists so the instrument can read young societies at all, and Myanmar is the obvious candidate. But d_5 computes to 0.495, below the activation threshold, because Myanmar's measured youth indicators — NEET at 15.0%, youth dependency 35.2 — are middling by regional standards; Laos and Timor-Leste both score far higher. The engine is saying that Myanmar's catastrophe is not demographic. It is a coercive-monopoly failure that happens to be occurring in a young country, and the youth-surplus mechanism is not what is driving it. Whether that is a correct reading or an artifact of the d_5 threshold is a live question, and

`d5_violent_thresh` is one of the two parameters that flips this verdict.

The stress branch

Relief-system failure and a further currency break — 22% inflation in 2025 is the baseline — move Ψ from 0.008 to 0.007. The stress branch is almost meaningless here, and deliberately so: civil conflict was NOT added as an event, because conflict at 0.95 already says what there is to say, and adding it would charge the coup twice.

What would have to be wrong

Two parameters flip the verdict, and one of them is the d_5 threshold that decides the L8 question above. The deeper limitation is data: Myanmar's fiscal series is the weakest in the set — the last usable tax-to-GDP observation is 2019, pre-coup — so every fiscal reading here inherits a seven-year-old baseline.

What to watch in 2027

— Township control counts, not territorial percentages. $\hat{S}_2$ is about monopoly and the township series is the closest observable.

— Whether the post-election administration extends actual service delivery anywhere. $\hat{S}_4$ at 0.089 is the floor, and it is the variable with room to move first.

— Kyat and inflation. 22% in 2025 with a_4 at 0.78 is the extraction base disappearing in real time.

— Whether youth mobilisation becomes a driver in its own right — the L8 question the engine currently answers 'no' to.

What the engine does not say

An Equilibrium band here is a mathematical artifact of Δ_norm being small because BOTH S and C have collapsed, not a statement that anything is balanced. Read the tier and θ_{25}, not the band.

This is INTERPRETATION, not engine output. The engine emits a band, a tier, a mode, a loop set and a gate order; it does not emit an argument about what they mean. The companion technical report (SCCDX-2027-MM-en.pdf) carries the numbers and provenance tags this reading stands on.
