SCCD-X v2.00 · PROSE READING · THE 2027 FORECAST

Philippines (PH)

The only tier change inside the window

Run 2026-10-09 · horizon to end-2027 · LSODA

The figures this reading rests on

Band	Tier	Mode	Ψ 2027	θ₂₅	Δ_norm	R_B
Equilibrium	Incoherent	MIXED	0.234	0.996	+0.008	0

Loops L1+L2+L3 · Nearest gate s3 ~0y (c5 crossed) · At 15 years Crisis / Incoherent

The Philippines is the one polity in the eleven whose verdict moves inside 2027 on the baseline, with no stress events added. It enters the window Equilibrium / Strained and leaves it Equilibrium / Incoherent, with the crossing at roughly t = 0.25 — early 2027. It is also the only row where three of sccd's four ORIGINAL loops are running at once.

CAI_core is 3.0 here, the highest in the region. That number matters more than the extended CAI because L1–L4 are the loops the source paper specifies and calibrates; the four new ones are all ANALYST. So when the Philippines posts three of the original four, the engine is making a claim inside its best-supported machinery rather than in the layer this project added.

L1, the Regulatory Capture Accelerator, arms because both of its PAPER conditions are met simultaneously: $\hat{C}_1$ is 0.77, above the 0.70 capture threshold, while $\hat{S}_2$ is 0.54, below the 0.60 floor. Russia in the stock preset set has more extreme capture and L1 does not arm, because its coercive monopoly is intact. The Philippine combination — concentrated, politically activated capital alongside a state that does not fully monopolise force — is the specific pairing the loop was written for.

L2, the Legitimacy Death Spiral, is the one that moves inside the window. $\hat{S}_3$ crosses its 0.30 PAPER floor at t = 0.33, and the coherence tier breaks to Incoherent slightly before that. The measured and researched basis is the flood-control scandal: the Department of Finance costing the loss at up to PHP 118.5bn over 2023–25, a 600,000-strong rally in November 2025, 37 criminal complaints filed, and — as of February 2026 — not one sitting legislator detained. The gap between the scale of the outrage and the absence of consequence is the mechanism. Legitimacy capital is spent by demonstrating that the rules do not bind the people who write them.

L3 is fed by the Marcos–Duterte rupture, which is now institutional rather than factional: the Vice-President's second impeachment trial has run since 6 July 2026, the Senate court altered its own conviction threshold in September, and a verdict was reported as possible by mid-December. $\hat{C}_5$ has already crossed 0.50.

Underneath the politics sits the Block A exposure, which is the highest in the region: white-collar exposure of 0.72 against a measured generative-AI diffusion rate of 0.207, third-highest here. The BPO sector is precisely the class of cognitive work the Displacement Hypothesis describes being substituted. Against that, labour exit is 0.85 with remittances at 8.5% of GDP — the exit option is institutionalised, which both relieves pressure and caps how much further $\hat{C}_4$ can rise.

The stress branch

Adding the impeachment aftermath and BPO displacement roughly halves Ψ, 0.234 to 0.115, without changing the verdict — because the verdict is already Incoherent. That is the signature of a polity with no headroom: the stress does not move the label, it just deepens the hole. At fifteen years the engine reads Crisis / Incoherent.

What would have to be wrong

Only two parameters flip the verdict at ±20%, so the reading is comparatively robust by OAT. But the s_3 level itself carries an ANALYST drawdown of 0.30 for the scandal, and s_3 is sccd's own highest-risk proxy and is BLOCKED — no cross-national source exists for two of its four pillars. The tier change at t = 0.25 is a direct consequence of where that drawdown put the starting level.

What to watch in 2027

— The impeachment verdict and what follows it. A conviction and an acquittal push $\hat{C}_5$ in the same direction; what differs is whether $\hat{S}_3$ recovers at all.

— Whether any sitting legislator is actually detained. On the engine's logic this is the single most legitimacy-restorative event available.

— BPO headcount. A measured contraction would convert the Block A exposure from a projection into an observation.

— Remittance flows. They are holding the floor under household income; a fall would load d_1 and d_5 at once.

What the engine does not say

Everything above is ordinal. The engine does not say the Philippines will have a crisis in 2027; it says the tier breaks inside the window on current drifts, that three PAPER-specified loops are running, and that the nearest gate is already at zero years.

This is INTERPRETATION, not engine output. The engine emits a band, a tier, a mode, a loop set and a gate order; it does not emit an argument about what they mean. The companion technical report (SCCDX-2027-PH-en.pdf) carries the numbers and provenance tags this reading stands on.
