SCCD-X v2.00 · PROSE READING · THE 2027 FORECAST

# Singapore (SG)

*The only polity where the decoupling is measurable*

Run 2026-10-09 · horizon to end-2027 · LSODA

**The figures this reading rests on**

| Band | Tier | Mode | Ψ 2027 | $\theta_{25}$ | Δ_norm | R_B |
|---|---|---|---|---|---|---|
| Hegemonic | Coherent | VOLUNTARY ADJUSTMENT | 1.269 | 0.993 | +0.371 | 0 |

Loops L5 · Nearest gate c5 ~13y · At 15 years Negotiated / Coherent

Singapore reads Hegemonic / Coherent in 2027 with a single loop running, and is the only one of the eleven where the Displacement Hypothesis's central claim can be tested against a measured adoption rate rather than inferred. Its decoupling index is 0.485; the next-highest in the region is 0.046.

---

Microsoft's Q2 2026 diffusion figure puts 64.3% of Singaporean working-age adults using a generative-AI product — second in the world behind the UAE. That single measured number is what makes this row unusual. Everywhere else in the region Block A's $a_1$ is either a smaller printed figure or an analyst estimate scaled off internet penetration; here the adoption is high enough, and well enough measured, that the mechanism has something to bite on.

The mechanism is L5, the Agency–Legitimacy Spiral, and it is the one loop the engine's own documentation flags as its weakest link. The chain runs: high penetration times high white-collar exposure produces agency erosion, and agency erosion drains legitimacy, because consent of the governed is made of the self-authorship the paper says is dissolving. The project's open problem OP2-2 states plainly that this link is argued, not measured — the source paper documents agency erosion and documents capital reallocation, and documents no fall in regime legitimacy anywhere. Singapore is where that argument is most exposed, because here the antecedent is real and measured. If L5 is spurious, this is where the absence should show.

What `decoupling_active` means in practice is that Δ_norm and Ψ can move in opposite directions — the engine's output convention breaks, and it says so rather than hiding it. Singapore's windfall term is the largest in the region ($a_6 = 0.78$) and raises G, while the agency term pushes $S_3$ down. A v1.00 reading, which has only the five Δ bands, would report this as untroubled growth.

The gate order is distinctive too. For every other polity in the region the nearest gate is $\hat{S}_3$ or something already crossed. For Singapore it is $\hat{C}_5$ at about thirteen years, with $\hat{S}_3$ at twenty-one and $\hat{S}_5$ at thirty-two. $\hat{S}_2$ is effectively never — the projection returns tens of thousands of years, which is the engine's way of saying the drift is numerically zero. So the thing that closes first here is fragmentation, not fiscal capacity and not coercive monopoly.

One choice in the input file deserves flagging, because it is the most contestable in the whole set: Singapore is read as a developmental autocracy rather than a liberal democracy. The justification is narrow — state_type only sets three weights, and on those three the WGI 2025 vector (government effectiveness 95th percentile, voice and accountability 55th) fits that row better. The counterfactual was run: band, tier, loop set and R_B all hold, and Δ_norm moves from +0.371 to +0.329. The choice costs almost nothing, which is the honest reason to stop arguing about it.

### The stress branch

White-collar displacement at 0.60 and a visible agency crisis at 0.40, on top of the tariff shock, take Ψ from 1.269 to 1.077 — a 15% fall with no change of band. Singapore absorbs more stress without moving than anything else in the region except Brunei. At fifteen years it steps down one band to Negotiated / Coherent.

### What would have to be wrong

Two parameters flip the verdict, one of which (a1_mass_thresh) switches L5 off entirely at +20%. So even here, with the best-measured adoption rate in the region, whether the loop appears at all turns on an ANALYST threshold.

### What to watch in 2027

— Whether the diffusion rate keeps climbing or plateaus. The L5 trigger is a threshold on $a_1$, not on its rate of change.

— Any measurable movement in institutional-trust or consent indicators. This is the observation OP2-2 says does not yet exist anywhere.

— Whether the AI windfall shows up in general revenue or stays with capital. The engine routes $a_6$ into G; where it lands determines whether it offsets the legitimacy drain or widens it.

### What the engine does not say

L5 is the single least evidenced construct in the v2 layer and it is the only loop running here. A Singapore reading that drops L5 has no loops at all and nothing to say beyond 'Hegemonic / Coherent'.

This is INTERPRETATION, not engine output. The engine emits a band, a tier, a mode, a loop set and a gate order; it does not emit an argument about what they mean. The companion technical report (SCCDX-2027-SG-en.pdf) carries the numbers and provenance tags this reading stands on.
